Mr. Roger Hansen – Airport Manager  
Gillespie County Airport  
101 W. Main – Unit 9  
Fredericksburg, TX 78624

Re: Master Plan Drainage Report  
City of Fredericksburg, TX  
TxDOT CSJ 1214FRBRG  
Klotz Associates Project No. 0500.036.000

Dear Mr. Hansen,

Klotz Associates, Inc. is pleased to submit the Master Plan Drainage Report for the future build out of the Gillespie County Airport, located just outside of Fredericksburg, see Exhibit 1 – Vicinity Map. The report outlines the near-term and long-term drainage improvement projects necessary to fully mitigate the proposed future development within the airport complex. The plan breaks the future development into three (3) phases as follows:

- Phase 0 - Pre-Development Improvements (Interim)
- Phase 1 – Near-Term Improvements (Proposed)
- Phase 2 – Long-Term Improvements (Ultimate)

Gillespie County Airport encompasses approximately 201.4 acres, with approximately 143.9 additional acres being off-site. Runoff from both on-site and off-site areas drain towards its two outfalls. The report models the existing, interim, proposed, and ultimate conditions of the airport to define the flows (release rates) at the two outfalls leaving the property, see Exhibit 2a – Drainage Area Map (Existing). Outfall-1 is the existing 36-inch reinforced concrete pipe (RCP) that drains southwest into Lady Bird Johnson Municipal Park and Golf Course (Lady Bird Park). Outfall-2 is the existing dual three-foot by four-foot (2~3'x4') reinforced concrete box (RCB) that drains to the southeast under State Highway 16 (SH 16). This report defines the necessary on-site drainage and detention facilities to mitigate the developed flows from the revised drainage patterns and proposed increased impervious cover to below the existing condition allowable release rates.

Based on the current City of Fredericksburg drainage criteria, storm water detention ordinance, and conversations with the City's Engineering Department and TxDOT's Hydraulic Section, a hydrology study was developed comparing the pre- and post-development storm water runoff. A HEC-HMS model, Version 3.5, was developed for the existing condition, along with a proposed condition, and a fully built-out ultimate condition. An interim condition model was created to assist with the necessary improvements to mitigate the initial revised drainage patterns. An SCS Hydrograph, based on Curve Numbers, was developed to analyze the storm water runoff for the 2-, 10-, and 100-year storm events (see

Table 1 for the model input and Tables 3-5 for model output). The resulting storm water runoffs were routed through the existing and proposed detention facilities to determine the maximum storage elevation and peak outfall in each condition, as noted below.

**EXISTING CONDITION**

The majority of the existing development within the airport currently drains through an existing detention basin located north of the airport terminal apron, locally referred to as the “Buffalo Wallow,” before flowing under the taxiway and runway and ultimately through the Lady Bird Park at Outfall-1, see Exhibit 3a – HMS Layout (Existing). Off-Site Areas #2 and #3 drain south through an existing swale along the airport’s property line and combine with the southern half of the runway and taxiway and ultimately outfall at Outfall-2 under SH 16. The drainage area summary table, including the acreages, SCS Curve Numbers, and Lag Times are shown in Table 1 – HMS Input Summary.

During large rain events, the water in the Buffalo Wallow can also be diverted to the south along the taxiway through a 30-inch culvert under the cross taxiway, down the east side ditch, through a set of 24-inch RCPs and ultimately flow south into Outfall-2’s system. The detention and diversion rating tables are shown in Table 1. The existing condition allowable release rates at the two outfalls are:

<b>Storm Event</b>	<b>Outfall-1 (Lady Bird Park)</b>	<b>Outfall-2 (SH 16)</b>
100-Year	312.8 cfs	1,127.9 cfs
10-Year	151.6 cfs	664.3 cfs
2-Year	58.4 cfs	319.1 cfs

**PROPOSED CONDITION**

Based on the recently updated “Airport Layout Plan” (ALP), several proposed improvements have been identified for future projects that are anticipated being constructed within the current boundaries of the airport, see Exhibit 4 – ALP Drainage Improvement Phasing. Additionally, the airport has a future plan to potentially expand outside of the current property boundaries, and will be considered as the ultimate condition model. The future development identified as proposed in the model is predominantly located within Drainage Areas (D.A.) A-1N, A-1S, A-3, A-4, and IP (Industrial Park), see Exhibit 2b – Drainage Area Map (Proposed) and Exhibit 3b – HMS Layout (Proposed). The increased impervious cover will be mitigated from two (2) proposed projects, namely the construction of Reservoir #1 and the modification to the Buffalo Wallow detention basin.

Reservoir #1 will be constructed to receive the developed flows from D.A. A-1N and IP directly, and outfall through a 30-inch RCP (Reach #4) into the regraded outfall swale south of Fair Drive at Junction #2. This is effectively a diversion of 48.2 acres that drained to Outfall-1 in the existing condition into the Outfall-2 system. This diversion will be offset by a berm placed near the outfall from the Buffalo Wallow to block the existing diversion into D.A. A-2 and contain the proposed flows within the Outfall-2 system. This removal of acreage and associated flows allows the construction of the proposed runway and

taxiway extension at the north end of the airport and a series of hangars within D.A. A-1S and A-3, without additional mitigation.

Additionally, the modifications to the Buffalo Wallow include reducing the footprint of the existing detention basin, and reclaiming approximately 2.5 acres of developable land along Airport Road for future apron and hangars. The volume will be modified through deepening the bottom to tie directly into the existing 36-inch RCP outfall by removing the inlet drop structure. This modification will reduce the volume within the basin from 14.7 acre-feet (ac-ft) to 5.0 ac-ft, but will still provide enough detention to control the proposed release rate at Outfall-1 to less than the existing condition.

Due to the reallocation of flow that will be diverted into Reservoir #1 and ultimately Outfall-2, approximately 4.3 acres will be allowed to be developed within Outfall-1's system once the culverts are removed under Airport Road without further mitigation, namely the Runway 14 extension and west hangar expansion. The remaining 9.3 acres of proposed development within the Outfall-1 system will be mitigated within the modified Buffalo Wallow. The Buffalo Wallow modification cannot be phased and will need to be constructed simultaneously with the final build out of this area.

D.A. A-1N and IP will drain directly into Reservoir #1 while the proposed improvements in D.A. A-4 will be mitigated from the over-detained release rate coming out of Reservoir #1. The detention volume needed to fully mitigate the 39.2 acres of future impervious cover within this system is 23.6 ac-ft. The total excavated volume to obtain 23.6 ac-ft of detention volume is approximately 47,600 cy, and this equates to a 0.75 ac-ft/ac detention factor for this area, or approximately 1,210 cubic yards (cy) of detention excavation for every acre of future impervious cover. By recommending the airport excavate the entire volume within Reservoir #1 as part of the Phase-0 improvements, an "Impact Fee" could be implemented for the purchase of detention capacity within the basin at a typical construction cost of \$10.00 per cy, or \$12,100 per acre of increased impervious cover.

The proposed condition release rates at the two outfalls are:

<b>Storm Event</b>	<b>Outfall-1 (Lady Bird Park)</b>	<b>Outfall-2 (SH 16)</b>
100-Year	246.0 cfs	1,074.4 cfs
10-Year	131.1 cfs	635.4 cfs
2-Year	57.0 cfs	305.6 cfs

**ULTIMATE CONDITION**

The ultimate condition model includes the potential improvements to the airport when additional land is acquired along the southeast edge of the taxiway, between Junction #2 and #3, see Exhibit 2c – Drainage Area Map (Ultimate) and Exhibit 3c – HMS Layout (Ultimate). The additional hangar and taxiway space will require mitigation to be provided within Reservoir #2 just downstream of Junction #2. Additionally, these improvements will require the realignment of the outfall drainage swale to run parallel to the future airport entrance drive.

The ultimate build out of the future improvements within D.A. A-4 and OF-3 will be mitigated by Reservoir #2, along with the relocated outfall channel along the future airport entrance drive to Junction #3. The detention volume needed to fully mitigate the 16.7 acres of future impervious cover within this system is 4.5 ac-ft. The excavated volume to obtain 4.5 ac-ft of detention volume equates to a 0.35 ac-ft/ac detention factor for this area, or approximately 565 cubic yards (cy) of detention excavation for every acre of future impervious cover.

Reservoir #2 will be constructed in phases just south of Fair Drive, adjacent to the existing channel flowing south along the airport's property line. This basin will intercept flows from D.A. OF-2, as well as the outfall from Reservoir #1. A proposed weir structure with low flow pipe will be designed and constructed at the southern end of the ultimate basin to control flows. The airport will be responsible for construction the future main access road, the channel realignment and the ultimate outfall structure for Reservoir #2. Each future development as part of the ultimate phase will be responsible for 0.35 ac-ft of excavation per acre of increased impervious cover.

The ultimate condition release rates at the two outfalls are:

<b>Storm Event</b>	<b>Outfall-1 (Lady Bird Park)</b>	<b>Outfall-2 (SH 16)</b>
100-Year	246.0 cfs	967.5 cfs
10-Year	131.1 cfs	505.9 cfs
2-Year	57.0 cfs	240.2 cfs

### **IMPLEMENTATION PLAN**

This study has been prepared to establish a drainage plan to accommodate future growth at the Gillespie County Airport. As the airport development comes in, each system is proposed to have a specific detention factor associated with the future development within that area, based on the phasing of the improvement projects are shown in Exhibit 4 – ALP Phasing - Drainage Improvements. However, before any growth can take place, some improvements have to be made to the existing infrastructure. These improvements have been developed and referenced as Phase-0 (Interim). Exhibits 5a, 5b, 5c, and 5d document the general scope of work that is necessary to set the groundwork for future airport expansion. The Phase-0 (Interim) scope includes:

- Lower Airport Road (North) and install a 48" Culvert to drain D.A. A-1N towards Reservoir #1
- Construct full excavation within Reservoir #1 along Airport Road to Crosswind Lane
- Install 30-inch RCP storm sewer between Fair Drive and Airport Road
- Construct drainage ditch to convey flows to existing ditch, including improvements to deepen existing outfall channel, along eastern property line
- Plug and abandon existing storm sewer culverts under Airport Road at Buffalo Wallow
- Construct berm adjacent to taxiway to hydraulically separate the Buffalo Wallow from the existing diversion structure

These improvements will allow for the 100-yr flows from D.A. A-1N and IP to be moved from System #1 at Lady Bird Johnson Municipal Park and Golf Course to System #2 at SH 16 with no impact.

The estimated construction cost for the work noted above is \$675,000, and with 15% contingency, the improvements are approximately \$775,000. This does not include geotechnical or surveying for the project area, or design and construction oversight costs. A preliminary detailed cost estimate is provided in Table 2 – Phase-0 (Interim) Cost Estimate. Additionally, it was considered to phase the Phase-0 improvements by excavating a portion of the volume within Reservoir #1 and constructing a larger outfall pipe (estimated as a 66-inc RCP) to convey the higher flows from less detention, but the cost savings, approximately \$50,000, were not significant enough to recommend phasing the excavation within Reservoir #1. The benefit of excavating the full volume at once is the proposed development can be constructed much quicker, the turf establishment and slope protection within the basin will not be impacted with repetitive excavation projects, and the outfall structure and pipe will not require incremental sizing reductions to restrict flows based on additional volume.

Once the Phase-0 (Interim) improvements are complete, approximately 4.3 acres will be allowed to be developed within Outfall-1's system, namely the Runway 14 extension and west hangar expansion. Additionally, all future development within the Outfall-2 system, as identified in the ALP as "proposed", will be allowed to develop by paying an impact fee to purchase mitigation capacity in the recently constructed Reservoir #1.

The modification to the Buffalo Wallow detention system and outfall will allow the development of approximately 9.3 acres of additional apron and hangars along Airport Road. These improvements should be constructed simultaneously and cannot be phased.

The ultimate build out of the airport will occur upon acquisition of the additional land at the southeast corner of the airport, within D.A. OF-3. The improvements will include additional hangars and aprons along the taxiway, a future main entrance drive, and realignment of the existing outfall channel. Reservoir #2 will be constructed to provide 4.5 ac-ft of mitigation for the 16.7 acres of increased impervious cover. The road will encompass approximately 1.2 acres, requiring approximately 675 cy of detention. The airport will be responsible for construction the road, the channel realignment and the ultimate outfall structure for Reservoir #2, along with 675 cy of volume. Each future development as part of the ultimate phase will be responsible for 0.35 ac-ft of excavation per acre of increased impervious cover.

The land currently set aside in the ALP for the ultimate detention, see Exhibit 2c, is larger than needed for the anticipated airport development. The potential for a partnership exists with the adjacent offsite areas to utilize a portion of this set aside area for future expansion to the detention basin, or to provide additional mitigation should the future development within the airport be constructed at an impervious cover greater than currently designed for.

**CONCLUSION**

Based on a comparison of the hydrographs for the areas and at the two outfalls, there is no increased peak flow from the 2- through 100-year return period. Table 3 – 5 HMS Output Summary details the results from the HEC-HMS model. The 100-year water surface elevation in the pond is below the existing or proposed top of banks and conveyed within the proposed culverts.

Klotz Associates has prepared this Master Drainage Plan to assist with the future build-out of the Gillespie County Airport and to provide guidance for the drainage mitigation necessary for the design of the proposed improvements. Each future project will include a simplified validation of the phasing of this plan, including the detention factor calculation to effectively mitigate the proposed development, as defined with this report. Should you have any questions or require additional information, please feel free to contact me or Sheri Hollaway, P.E.

Sincerely,

William W. Conlan, P.E.  
Project Engineer  
Texas P.E. Firm Registration No. F-926
